Overview

• Alkaline Cleaners and Acid Etching:
  – use, management, and life extension methods
Common Cleaning Steps

• First step: Alkaline cleaners
  – Removal of greases, oils, waxes, dirt from the metal parts
  – Typically heated to accelerate the cleaning process
  – May include ultrasonics or agitation to accelerate the cleaning process

• Second step: Acid cleaning/etching
  – Removal of metal oxides (rust, smut, etc.)
  – Makes the metal surface chemically active for the next step (plating, conversion coating, etc.)
Alkaline Cleaner Bath Life

• The cleaner chemical components are lost by:
  – Dragout to the rinse by parts
  – Reaction with the organics (emulsification, chelation, etc.)

• The cleaner effectiveness degrades as the oil and dirt loading goes up with potential redeposition of contaminants
Cleaner Monitoring

• The chemical supplier should be able to provide test kits or test methods to monitor the cleaner chemistry
• Make cleaner chemistry additions based on the test results
Cleaning the Cleaner

- Cooling a cleaning bath sometimes causes the oils to come out of emulsion and can then be skimmed off (weekend shutdowns)
- Continuous in-tank filtration can usually remove suspended solids (typical polymer filters cannot tolerate solution temperatures >120º F)
- In-tank spargers and weirs can help remove surface oils
- High temperature, high pH tolerant metal or ceramic ultrafiltration can remove colloidal solids and emulsified oils, in most cases without removing any of the cleaning chemistry
Filtration Levels Overview

http://www.kochmembrane.com/sep UF.html
Membrane Process Characteristics

http://www.kochmembrane.com/sep_uf.html
TiO$_2$/SS Material Micro-Ultrafiltration

- Arbortech equipment (benchtop demonstration)
- Filter able to remove solids and oil emulsions from a cleaner at 200º F and pH of 1-14

The Washer Washer Membrane - How it really works.

Small cleaning solution molecules pass through membrane. This recycled solution is called permeate and it is returned to your wash tank.

Larger oil molecules cannot fit through the membrane. This is called the reject and it is returned to the process tank where the oil accumulates, is removed, and disposed.

Legend
- Cleaner molecules
- Oil Molecule
- Membrane Skin

Case Study

Chromate/E-Coat Paint Line - Midwest Engine Manufacturer

2005 Costs

- Washer Washer $39,512
- Stands $2,080
- Miscellaneous (Install Parts & Labor) $4,000
- Total $45,592

Client Documented Savings

- Cleaner $37,901.74
- Waste Treatment $7,108.92
- Total $45,010.66

R.O.I.

R.O.I. = Costs of Implementation/Benefits
R.O.I. = $45,592/$45,010.66
R.O.I. = 1.01 years

Data provided by Arbortech
Acid Applications

• Acid Pickling
• Stripping baths
• Activation baths
• Deoxidizer Passivation baths
• Anodizing
• Electropolishing
• Etching
Acid Bath Life

• Acid is consumed (expended) as it dissolves metal in the cleaning process
• Acid is consumed by alkali dragged into the bath from previous cleaning tanks
• Therefore, active acid goes down and dissolved metal goes up as the bath is used
• Metal (solid) + Acid (H+, anion -) → Metal ion (+, dissolved) + nitrate ion or chloride ion or phosphate, etc.(-)
• Acid dragout into acid rinse
Acid Control

• Monitor acid levels, dissolved metal levels
  – Titration
  – Specific gravity
  – Other methods such as spectroscopy, near infrared, viscosity, etc.
  – Automated systems such as the Scanacon Analyzer*

• Make acid additions based on remaining acid in the bath

• Dissolved metal may interfere with the acid reactions (example, sulfuric acid anodizing bath)

*Scanacon.com
Cost of Dumping an Acid Bath

- Cost of neutralizing the remaining acid in the bath
- Cost of replacing all the acid in the new bath
- Cost of rework due to end-of-life poor cleaning of parts
- Cost of metal sludge filtration and disposal in waste treatment
- Labor costs of waste treatment and making up a new bath
- Labor cost of reporting for hazardous material use and disposal
Acid Bath Maintenance

• Maintaining the acid concentration produces more consistent metal etching and cleaning
• Filtration of the solution will remove any suspended solids
• Surface sparging to a weir will remove floating oils and floating dirt
Acid Life Extension involves increasing the usable life of an acid bath while reducing the amount of acid consumed, consequently reducing the number of times the acid bath is dumped and making the process more consistent, over a given time period.
Various Technologies

• Purpose of each technology is to reduce the dissolved metal while recovering the unreacted acid
  – Chemical additives such as PRO-pHx
  – Diffusion Dialysis
  – Acid Sorption (resin column adsorption and flushing of acid)
Acid Life Extension

PRO-pHx:

“PRO-pHx is a catalyzed formulation carried by a proprietary blend of soluble silicates. It effectively immobilizes soluble metals by reacting with them to form insoluble metal silicates.

[It] will also react with volatile and non-volatile organic compounds to produce a non-volatile, non-toxic, non-hazardous waste. The precipitate is then easily filtered.”

PRO-pHx Equipment

In-tank Filtration

Overflow Filtration
PRO-pHx Study: Coating Technologies, Inc. and Anoplate

• Conducted a 11-month study to assess the performance of PRO-pHx on Muriatic and Nitric acid tanks

• Parameters monitored:
  • Dissolved metals
  • Volume of acid added
  • # of manufacturing defects
Findings

- All baths remained functional through the course of the study
- All baths experienced an increase in life by at least 2x (with some going up to 20x)
- No defects were traceable to poor acid quality
- **Current status**: Some tanks were run for 3 years without dumping (tanks were dumped for other reasons such as maintenance issues, etc.)
Unexpected outcomes

- Metal concentration in many baths increased beyond typical operating ranges

- No effect on work-piece processing time or cleaning ability (bath activity stayed constant)

Diffusion Dialysis

• Diffusion: material movement along a concentration gradient (material moves from high concentration to low concentration)

• Dialysis: Material separation across a membrane based on molecule size and molecule charge. Human kidneys are expert systems at dialysis.
Diffusion Dialysis Process

- Want to separate the dissolved metal from the acid
- Want to have a relatively high acid concentration at least close to that of the original acid, i.e. don’t want a dilute acid stream
System Schematic

Schematic provided by Mech-Chem Associates, Inc.
Case Study: Nitric-Hydrofluoric Acid, A Common Stainless Steel Pickling Solution:

Expected System Performance:
• 80 – 90% Nitric Acid Recovery,
• 65 – 75% Hydrofluoric Acid Recovery,
• 70 – 90% Metals Removal.
